

fax2email feature based on [SpanDSP](#) has been added in the Switchfin [trunk](#)

How it works?

Currently we don't have the fax2email feature GUI configurable so it needs to be done manually in the config. files.

First you need to verify that your **ssmtp** agent is up and running. For details you may check [SMTP MTA with attachments built in Switchfin](#)

Then please create a DAHDI or SIP channel (you can use GUI for this) and put it in the context similar as the following:

```
[fax]
exten => 300,1,Answer()
exten => 300,2,Set(FAX_FORCE_V29=1)
exten => 300,3,RXFax(test.tif)
exten => 300,4,System(/bin/mailfile.sh test.tif someone@domain.tld)
exten => 300,5,Hangup()
```

That's it, Have fun!
